Professional Summary

Pre-final year Computer Science student specializing in Artificial Intelligence and full-stack development. Experienced in designing and deploying end-to-end AI applications — from inference pipelines and NLP systems to responsive frontends and tested backend APIs. Comfortable working across the full stack with Python, FastAPI, React, and MongoDB, with practical exposure to cloud platforms including Google Cloud and Microsoft Azure. Seeking internship or AI/ML roles where I can contribute to real-world systems from day one.

Education

Technocrats Institute of Technology — Bhopal, India
Bachelor of Technology in Computer Science (AI) — *2023 – 2027*
- Core Coursework: Data Structures & Algorithms, Object-Oriented Programming, Artificial Intelligence, Software Engineering, Database Management Systems.

The Radiant School — Gwalior, India
Senior Secondary Education (Class XII) — *2022*

Technical Skills

Languages: Python, C++, Java, JavaScript, GDScript, HTML/CSS
Frameworks & Databases: FastAPI, React, Next.js, Node.js, MongoDB, JWT
AI & Cloud: NLP, Generative AI, Speech-to-Text, Groq/LLaMA, Google Cloud, Microsoft Azure
Tools & Dev: Git/GitHub, GitHub Actions, Godot Engine, Salesforce CRM, VS Code

Projects

Qualif-AI: AI Interview Simulator | *FastAPI, React, MongoDB, Groq/LLaMA, JWT* | Live — 2026
- Built a voice-first full-stack mock interview platform with two modes: Quick Practice (8 adaptive questions) and a structured 4-phase Complete Interview that parses the user's uploaded resume to ask about their specific projects and experience.
- Designed a hybrid scoring engine blending 72% LLM (Llama 3.3 70B via Groq) with 28% deterministic signals — keyword coverage per topic, answer structure detection, and depth analysis — for consistent, explainable results.
- Implemented an adaptive skill graph tracking mastery across 35+ skills in 7 categories with exponential session weighting; next question always targets the user's weakest unpractised skill.
- Built answer benchmarking system: generates and permanently caches an ideal answer per question in MongoDB; compares user answers on covered concepts, missing concepts, extras added, and similarity score.
- Added prompt injection protection via regex sanitisation and explicit LLM-level rules; question deduplication via 8-character hash fingerprinting across 25+ sessions.
- Deployed 103 automated tests via GitHub Actions — tests caught 5 real production bugs; backend on Render, frontend on Vercel, with UptimeRobot pinging health endpoint every 5 minutes.

CodeQuest: Syntax Scrolls | *Godot Engine, GDScript, Python* — 2025
- Developing a 2D RPG in Godot Engine where players write real Python code through an in-game console to solve puzzles, interact with NPCs, and unlock new areas — making programming a gameplay mechanic rather than a tutorial exercise.
- Built modular systems for player movement, camera control, NPC dialogue, quest tracking, and map transitions using a data-driven design that lets new quests and challenges be added without modifying core game logic.
- Implemented a custom logic engine that evaluates player code solutions against expected outputs, generates targeted feedback, and updates quest state based on solution correctness.

Certifications

Google AI Essentials | Google (2026)
Introduction to Generative AI | Google Cloud Skill Boost (2025)
Introduction to Responsible AI | Google Cloud Skill Boost (2025)
